It covers various engineering subfields, such as electrical devices and circuits, and their electronic counterparts. Based on the idea that a modern university course should provide students with conceptual tools to understand the behavior of both linear and nonlinear circuits, to approach current problems posed by new, cutting-edge devices and to address future developments and challenges, the book places equal emphasis on linear and nonlinear, two-terminal and multi-terminal, as well as active and passive circuit components. This second volume focuses on dynamical circuits, which are characterized by time evolution and by the concept of state. The content is divided into a set of introductory and a set of advanced-level topics, mirroring the approach used in the previously published volume. Whenever possible, circuits are compared to physical systems of different natures (e.g. mechanical or biological) that exhibit the same dynamical behavior. The book also features a wealth of examples and numerous solved problems. Further topics, such as a more general framing of linear and nonlinear components, will be discussed in volume 3.* **Night Club & Bar RFID Monthly Newsletter June 2010** [Information Gatekeepers Inc](#) **I-Byte Technology July 2021** [EGBG Services LLC](#) *ITShades.com has been founded with singular aim of engaging and enabling the best and brightest of businesses, professionals and students with opportunities, learnings, best practices, collaboration and innovation from IT industry. Advanced Load Identification and Management for Buildings** In response to the U.S. Department of Energy (DoE)'s goal of achieving market ready, net-zero energy residential and commercial buildings by 2020 and 2025, Eaton partnered with the Department of Energy's National Renewable Energy Laboratory (NREL) and Georgia Institute of Technology to develop an intelligent load identification and management technology enabled by a novel "smart power strip" to provide critical intelligence and information to improve the capability and functionality of building load analysis and building power management systems. Buildings account for 41% of the energy consumption in the United States, significantly more than either transportation or industrial. Within the building sector, plug loads account for a significant portion of energy consumption. Plug load consumes 15-20% of building energy on average. As building managers implement aggressive energy conservation measures, the proportion of plug load energy can increase to as much as 50% of building energy leaving plug loads as the largest remaining single source of energy consumption. This project focused on addressing plug-in load control and management to further improve building energy efficiency accomplished through effective load identification. The execution of the project falls into the following three major aspects; An intelligent load modeling, identification and prediction technology was developed to automatically determine the type, energy consumption, power quality, operation status and performance status of plug-in loads, using electric waveforms at a power outlet level. This project demonstrated the effectiveness of the developed technology through a large set of plug-in loads measurements and testing; A novel "Smart Power Strip (SPS) / Receptacle" prototype was developed to act as a vehicle to demonstrate the feasibility of load identification technology as a low-cost, embedded solution; and Market environment for plug-in load control and management solutions, in particular, advanced power strips (APSS) was studied. The project evaluated the market potential for Smart Power Strips (SPSS) with load identification and the likely impact of a load identification feature on APS adoption and effectiveness. The project also identified other success factors required for widespread APS adoption and market acceptance. Even though the developed technology is applicable for both residential and commercial buildings, this project is focused on effective plug-in load control and management for commercial buildings, accomplished through effective load identification. The project has completed Smart Receptacle (SR) prototype development with integration of Load ID, Control/Management, WiFi communication, and Web Service. Twenty SR units were built, tested, and demonstrated in the Eaton lab; eight SR units were tested in the National Renewable Energy Lab (NREL) for one-month of field testing. Load ID algorithm testing for extended load sets was conducted within the Eaton facility and at local university campuses. This report is to summarize the major achievements, activities, and outcomes under the execution of the project. **Methodologies and Intelligent Systems for Technology Enhanced Learning 7th International Conference** [Springer](#) This book presents the outcomes of the 7th International Conference in Methodologies and Intelligent Systems for Technology Enhanced Learning (MIS4TEL'17), hosted by the Polytechnic of Porto, Portugal from 21 to 23 June 2017. It also fostered entrepreneurship and business startup ideas, bringing together researchers and developers from industry, education and the academic world to report on the latest scientific research, technical advances and methodologies. **Next Generation Society Technological and Legal Issues Third International Conference, e-Democracy 2009, Athens, Greece, September 23-25, 2009, Revised Selected Papers** [Springer Science & Business Media](#) Recent developments in information and communication technology (ICT) have paved the way for a world of advanced communication, intelligent information processing and ubiquitous access to information and services. The ability to work, communicate, interact, conduct business, and enjoy digital entertainment virtually anywhere is rapidly becoming commonplace due to a multitude of small devices, ranging from mobile phones and PDAs to RFID tags and wearable computers. The increasing number of connected devices and the proliferation of networks provide no indication of a slowdown in this tendency. On the negative side, misuse of this same technology entails serious risks in various aspects, such as privacy violations, advanced electronic crime, cyber terrorism, and even enlargement of the digital divide. In extreme cases it may even threaten basic principles and human rights. The aforementioned issues raise an important question: Is our society ready to adopt the technological advances in ubiquitous networking, next-generation Internet, and pervasive computing? To what extent will it manage to evolve promptly and efficiently to a next-generation society, addressing the forthcoming ICT challenges? The Third International ICST Conference on e-Democracy held in Athens, Greece during September 23–25, 2009 focused on the above issues. Through a comprehensive list of thematic areas under the title "Next-Generation Society: Technological and Legal issues," the 2009 conference provided comprehensive reports and stimulated discussions on the technological, ethical, legal, and political challenges ahead of us. **Merging the Instructional Design Process with Learner-Centered Theory The Holistic 4D Model** [Routledge](#) Merging the Instructional Design Process with Learner-Centered Theory brings together the innovations of two previously divided processes — learning design strategies/theories and instructional systems development — into a new introductory textbook. This eye-opening book shows how a new technology may soon track your every move . . . and pave the way for the fulfillment of end-time biblical prophecy. A revolutionary technology called RFID (Radio Frequency Identification) is poised to expose our habits, secrets, and slip-ups to money-hungry marketers, savvy criminals, and government snoops. One day soon, our shoes could keep track of our footsteps. Stores could ID us as we walk in the door. Hidden "tracking units" could log even our restroom visits. Global corporations and government agencies have already invested millions in a plan that uses tiny microchips to uniquely number and track everyday items. Parts of this Orwellian vision are uncannily similar to the prophecies of Revelation. Chipping inanimate objects is just the start—the endpoint is a form of RFID that can be injected into the flesh. This work—an updated version of Katherine Albrecht and Liz McIntyre's controversial and award-winning book Spychips—is a clarion call to Christians to take a stand against plans to monitor and control people through this unnerving new technology. Using public records, real-world examples, and biblical prophecies, Albrecht and McIntyre uncover the frightening story behind RFID and show us how to protect our privacy and civil liberties while there's still time.
