## Dissonances of the Mind

### Psychopathology as Disturbance of the Brain Technology

*STANISLAV TREGUB* In psychotherapy and psychiatry, mental illness diagnostics is limited to the description of symptoms and has nothing to do with assessing the state of the organ that performs the mental functions. In other branches of medicine, any diagnosis aims to answer the question about the physical disturbance of the internal technology of the body. But the Mind remains outside of this correct approach. As a result, all systemic mental pathologies are currently incurable. This absurd situation is due to the lack of a physically grounded theoretical model of the Mind. Without it, practical treatment of the disorders remains 'wandering in the dark.' How can we fix something if there is no understanding of what it is and how it works? Within the Teleological Transduction Theory that the author consistently developed in the previous volumes of the series, harmony of the Mind is a physical concept of normal functioning. Respectively, when he describes the pathologies as dissonances, it is not a metaphor but a reference to the physical and technological malfunction leading to the disintegration of consciousness. The author does not aim to describe all pathologies in this book. His mission is to create a concept as a universal tool that can be used in different situations and various ways. The author suggests an entirely novel approach to analysing, diagnosing, and classifying mental pathologies. As an example, he develops a model of such systemic pathologies as autism and schizophrenia, uncovering the essence of the underlying problem that causes the observed symptoms. This physical, physiological and technological explanation of the states of chronic dissonance of the Mind may be the beginning of the transition to the actual diagnosis and treatment of mental illnesses as brain disorders.

### Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles

*National Academies Press* The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

## Research into Design for a Connected World

### Proceedings of ICoRD 2019 Volume 1

*Springer* This book showcases cutting-edge research papers from the 7th International Conference on Research into Design (ICoRD 2019) - the largest in India in this area - written by eminent researchers from across the world on design processes, technologies, methods and tools, and their impact on innovation, for supporting design for a connected world. The theme of ICoRD'19 has been "Design for a Connected World". While Design traditionally focused on developing products that worked on their own, an emerging trend is to have products with a smart layer that makes them context aware and responsive, individually and collectively, through collaboration with other physical and digital objects with which these are connected. The papers in this volume explore these themes, and their key focus is connectivity: how do products and their development change in a connected world? The volume will be of interest to researchers, professionals and entrepreneurs working in the areas on industrial design, manufacturing, consumer goods, and industrial management who are interested in the use of emerging technologies such as IOT, IIOT, Digital Twins, I4.0 etc. as well as new and emerging methods and tools to design new products, systems and services.
