## The Making of the 1963 Baptist Faith and Message

Wipf and Stock Publishers Questions regarding the orthodoxy of Dale Moody and Ralph Elliott propelled the Southern Baptist Convention (SBC) toward a re-evaluation of its doctrinal statement, the Baptist Faith and Message (BFM). The SBC adopted this document in 1925 under the leadership of E. Y. Mullins when faced by the challenge of modernism. This dissertation argues that the 1962 Committee on Baptist Faith and Message produced a document that expressed subtle shifts in Baptist theology. This shift had the effect of assuring the conservative base while allowing enough latitude in interpretation for those serving in the academy to teach more "progressive" views. After a first, introductory chapter, chapters 2 and 3 trace the historical developments leading to the formation of the Committee. Biblical inspiration and interpretation were key concerns, but as chapter 3 demonstrates, other concerns drew the attention of the Committee. Chapters 4 and 5 deal with the ever-sensitive issue of the

relationship between Baptist confessionalism, soul liberty, and soul competency. Each chapter examines how Baptist confessionalism functioned in relation to these concepts. Chapter 6 examines in detail the work of the Committee itself and looks at those persons or groups who influenced the outcome of the Committee's work. Of special note are the contributions made by Wayne Ward, Leo Garrett, the religion faculty of Mercer University, and the theology faculty of Southern Seminary. Chapter 7 examines four areas where the 1963 BFM altered the confessional expression of Baptist doctrines: (1) Scripture; (2) Man; (3) Salvation; (4) The Church. Chapter 8 is the conclusion. Four appendices contain early drafts of the Committee's work.

## Geometry

McDougal Littell/Houghton Mifflin

## Geometry for College Students

American Mathematical Soc. **One of the challenges many mathematics students face occurs after they complete their study of basic calculus and linear algebra, and they start taking courses where they are expected to write proofs. Historically, students have been learning to think mathematically and to write proofs by studying Euclidean geometry. In the author's opinion, geometry is still the best way to make the transition from**

elementary to advanced mathematics. The book begins with a thorough review of high school geometry, then goes on to discuss special points associated with triangles, circles and certain associated lines, Ceva's theorem, vector techniques of proof, and compass-and-straightedge constructions. There is also some emphasis on proving numerical formulas like the laws of sines, cosines, and tangents, Stewart's theorem, Ptolemy's theorem, and the area formula of Heron. An important difference of this book from the majority of modern college geometry texts is that it avoids axiomatics. The students using this book have had very little experience with formal mathematics. Instead, the focus of the course and the book is on interesting theorems and on the techniques that can be used to prove them. This makes the book suitable to second- or third-year mathematics majors and also to secondary mathematics education majors, allowing the students to learn how to write proofs of mathematical results and, at the end, showing them what mathematics is really all about.
