Advances in Chitin/Chitosan Characterization and Applications

MDPI Functional advanced biopolymers have received far less attention than renewable biomass (cellulose, rubber, etc.) used for energy production. Among the most advanced biopolymers known is chitosan. The term chitosan refers to a family of polysaccharides obtained by partial de-N-acetylation from chitin, one of the most abundant renewable resources in the biosphere. Chitosan has been firmly established as having unique material properties as well as biological activities. Either in its native form or as a chemical

derivative, chitosan is amenable to being processed—typically under mild conditions—into soft materials such as hydrogels, colloidal nanoparticles, or nanofibers. Given its multiple biological properties, including biodegradability, antimicrobial effects, gene transfectability, and metal adsorption—to name but a few—chitosan is regarded as a widely versatile building block in various sectors (e.g., agriculture, food, cosmetics, pharmacy) and for various applications (medical devices, metal adsorption, catalysis, etc.). This Special Issue presents an updated account addressing some of the major applications, including also chemical and enzymatic modifications of oligos and polymers. A better understanding of the properties that underpin the use of chitin and chitosan in different fields is key for boosting their more extensive industrial utilization, as well as to aid regulatory agencies in establishing specifications, guidelines, and standards for the different types of products and applications.

Human Error in Aviation

Routledge Most aviation accidents are attributed to human error, pilot error especially. Human error also greatly effects productivity and profitability. In his overview of this collection of papers, the editor points out that these facts are often misinterpreted as evidence of deficiency on the part of operators involved in accidents. Human factors research reveals a more accurate and useful perspective: The errors made by skilled human operators - such as pilots, controllers, and mechanics - are not root causes but symptoms of the way industry operates. The papers selected for this volume have strongly influenced modern thinking about why skilled experts make errors and how to make aviation error resilient.

North American Rockwell T-2 Buckeye

Specialty Press (MN) The photos in this edition are black and white. First published in 1987, the T-2 Buckeye book covers the development of this all-purpose jet trainer from the Navy's solicitation to industry in 1956 through its operations and squadron usage with the US Navy, Marines, Venezuela and Greece. It was originally built as a single engine jet, the T2J-1/T-2A, but had inadequate power. A second engine was added and it became the over-powered T-2B. It was a tremendously over-designed and robust aircraft, perfect for students and virtually impervious to excess Gs. Late in life it was used as a spin trainer for fleet Tomcat pilots. 137 photos and 33 illustrations.
