Greenhouse Warming and Nuclear Hazards

A Series of Essays and Research Papers

World Scientific Publishing Company Incorporated Introduction : Greenhouse warming and nuclear hazards. Three smoking guns prove the falsity of greenhouse warming. Nuclear waste disposal, from trash to treasure. Cancer death rates of 50 states of U.S. related to natural and nuclear-bomb-test-induced low level radiation -- pt. I. Greenhouse warming. An essay on the controversy of greenhouse warming. Related research papers on the origin of ice ages. Latent heat of melting and its importance of glaciation cycles. Origin of ice ages : Initial condition forcing and dynamics. Unraveling a century's mystery of the ice ages. The fourth phase of water and the theories of greenhouse effects and ice age glacial cycles -- pt. II. Research papers on nuclear hazards. The ultimate direct measurement of low level radiation effects. Long life expectancy as the beneficial effect of low radiation. Low level radiation extends life span by cutting death rates of disease including heart disease, cancer, stroke, etc. Reexamining nuclear energy safety

An Explorer's Notebook

Essays on Life, History, and Climate

Grove Press Best known for his #1 international bestseller The Weather Makers, Tim Flannery is one of the world's most influential scientists, a foremost expert on climate change credited with discovering more species than Charles Darwin. But Flannery didn't come to his knowledge overnight. With its selection of exhilarating essays and articles written over the past thirty years, An Explorer's Notebook charts the evolution of a young scientist doing fieldwork in remote locations into the major thinker who has changed the way we think about global warming. In these thirty pieces, Flannery writes about his journeys in the jungles of New Guinea and Indonesia, about the extraordinary people he met and the species he discovered. He writes about matters as wide-ranging as love, insects, population, water, and the stresses we put on the environment. He shows us how we can better predict our future by understanding the profound history of life on Earth. And he chronicles the seismic shift in the world's attitude toward climate change. An Explorer's Notebook is classic Flannery--wide-ranging, eye-opening science, conveyed with richly detailed storytelling.

Exploring Climate Change through Science and in Society

An anthology of Mike Hulme's essays, interviews and speeches

Routledge Mike Hulme has been studying climate change for over thirty years and is today one of the most distinctive and recognisable voices speaking internationally about climate change in the academy, in public and in the media. The argument that he has made powerfully over the last few years is that climate change has to be understood as much as an idea situated in different cultural contexts as it is as a physical phenomenon to be studied through universal scientific practices. Climate change at its core embraces both science and society, both knowledge and culture. Hulme's numerous academic and popular writings have explored what this perspective means for the different ways climate change is studied, narrated, argued over and acted upon. *Exploring Climate Change through Science and in Society* gathers together for the first time a collection of his most popular, prominent and controversial articles, essays, speeches, interviews and reviews dating back to the late 1980s. The 50 or so short items are grouped together in seven themes - Science, Researching, Culture, Policy, Communicating, Controversy, Futures - and within each theme are arranged chronologically to reveal changing ideas, evidence and perspectives about climate change. Each themed section is preceded with a brief introduction, drawing out the main issues examined. Three substantive unpublished new essays have been specially written for the book, including one reflecting on the legacy of Climategate. Taken as a collection, these writings reveal the changes in scientific and public understandings of climate change since the late 1980s, as refracted through the mind and expression of one leading academic and public commentator. The collection shows the many different ways in which it is necessary to approach the idea of climate change to interpret and make sense of the divergent and discordant voices proclaiming it in the public sphere.

Greenhouse Warming and Nuclear Hazards

A Series of Essays and Research Papers

World Scientific This book is a rebuttal of the common belief that grave environmental consequences are associated with the issues of global warming and nuclear hazards. Firstly, it is argued that after 25 years of research no-one has actually found evidence for greenhouse warming. Instead, the heat has caused the evaporation of ocean water to increase cloud coverage, reflecting more sunlight away, cooling down the earth and nullifying the effects of greenhouse warming. The author describes this revolution in climatology through new scientific discoveries that solve the longstanding mystery of the ice ages and explain the enigma of the missing greenhouse heat. The solution of the ice age problem is a far most important scientific accomplishment. In the second part of the book, the author argues that the effects of low-level radiation can be beneficial rather than damaging. Evidence is presented proving that low-level radiation in the US from both natural sources and human activities such as nuclear bombs tests actually reduces death rates from cancer and other diseases and increases longevity. In the Indian State of Kerala life span has been shown to increase 10.5 years due to the natural radiation from thorium mines. The book proposes that primitive life forms must have developed immune systems to counter the harmful effects of natural radioactivity and that low-level radiation from nuclear waste may one day be transformed from trash to treasure. Nature has always been kind to humans. But our self-aggrandizing species has mistaken blessings for disasters and spoiled the otherwise splendid 20th century. Contents: Greenhouse Warming and Nuclear Hazards: Three Smoking Guns Prove the Falsity of Greenhouse Warming Nuclear Waste Disposal, from Trash to Treasure Cancer Death Rates of 50 States of US Related to Natural and Nuclear-Bomb-Test-Induced Low Level Radiation Greenhouse Warming: Latent Heat of Melting and Its Importance for Glaciation Cycles Origin of Ice Ages: Initial Condition Forcing and Dynamics Unraveling a Century's Mystery of the Ice Ages The Fourth Phase of Water and the Theories of Greenhouse Effects and Ice Age Glacial Cycles Research Papers on Nuclear Hazards: The Ultimate Direct Measurement of Low Level Radiation Effects Long Life Expectancy as the Beneficial Effect of Low Radiation Low Level Radiation Extends Life Span by Cutting Death Rates of Disease Including Heart Disease, Cancer, Stroke, etc. Reexamining Nuclear Energy Safety Readership: Undergraduates and general public. Climate Change and Common Sense

Essays in Honour of Tom Schelling

Oxford University Press There is widespread agreement that climate change is a serious problem. If we fail to regulate greenhouse gases that contribute to global warming, or use alternative strategies for addressing the problem, the damages could be significant, and perhaps catastrophic. After several international meetings in which nation-states have tried unsuccessfully to address the climate change problem, there is a sense of frustration and urgency: frustration at the slow pace at which countries are moving toward an international agreement to reduce greenhouse gas emissions; urgency because of the growing evidence that climate change is a serious problem that should be addressed globally and quickly. This book takes a close look at the fundamental political and economic processes driving climate change policy. It identifies institutional arrangements and policies that are needed to design more effective climate change policy. It also examines ethical and distributional arguments that are critical in understanding and framing the climate debate. The book is built around a conference honouring Tom Schelling that took place at the Sustainable Consumption Institute at The University of Manchester. Each chapter represents a significant contribution to the literature on the political economy of climate change.

Responding to the Climate Threat

Essays on Humanity's Greatest Challenge

Springer This book demonstrates how robust and evolving science can be relevant to public discourse about climate policy. Fighting climate change is the ultimate societal challenge, and the difficulty is not just in the wrenching adjustments required to cut greenhouse emissions and to respond to change already under way. A second and equally important difficulty is ensuring widespread public understanding of the natural and social science. This understanding is essential for an effective risk management strategy at a planetary scale. The scientific, economic, and policy aspects of climate change are already a challenge to communicate, without factoring in the distractions and deflections from organized programs of misinformation and denial. Here, four scholars, each with decades of research on the climate threat, take on the task of explaining our current understanding of the climate threat and what can be done about it, in lay language—importantly, without losing critical aspects of the natural and social science. In a series of essays, published during the 2020 presidential election, the COVID pandemic, and through the fall of 2021, they explain the essential components of the challenge, countering the forces of distrust of the science and opposition to a vigorous national response. Each of the essays provides an opportunity to learn about a particular aspect of climate science and policy within the complex context of current events. The overall volume is more than the sum of its individual articles. Proceeding each essay is an explanation of the context in which it was written, followed by observation of what has happened since its first publication. In addition to its discussion of topical issues in modern climate science, the book also explores science communication to a broad audience. Its authors are not only scientists - they are also teachers, using current events to teach when people are listening. For preserving Earth's planetary life support system, science and teaching are essential. Advancing both is an unending task.

Essays in the Economics and Political Economy of Climate Change

Empirical research on anthropogenic climate change is constrained by two fundamental facts: climate change is unprecedented and its impacts occur gradually. This implies that neither evidence from recent history nor the near future can directly inform policy. Under such circumstances, empirical research must find historical analogs capturing particular features of future climate change and policy, which, combined with theory, can provide credible out-of-sample predictions. The four papers in this dissertation use new data settings and methodologies to causally examine central questions related to climate change mitigation, adaptation, innovation, and impacts. Results from these papers can help inform future climate-related research and various issues regarding the political economy of climate policy.

He also chronicles the recent seismic shift in the world's attitude toward climate change, noting the deep impact felt by all of us. He writes on a wide variety of topics, from the huge increase in the number of accidental falls experienced by Winnipeg pedestrians each winter to the huge decrease in traditional circumcisions in the African Samburun tribe—a decrease that is devastating the tribe's social order. For the millions who read *The Weather Makers* and for those interested in wildlife or the environment -- and in wonderful storytelling -- *An Explorer's Notebook* is a must-read book.

Two Essays on Climate Change and Agriculture

A Developing Country Perspective

Food & Agriculture Org. Agriculture and climate changes are closely linked. Agriculture has a significant impact on the process of climate change. There is uncertainty surrounding the implications of climate change for agricultural production. This document consists of two studies on this relationship. The first study provides an analysis of the various methodologies that have been used to measure the potential impacts of climate change on agricultural production and makes suggestions for further research. The second study is on the impact of agriculture on climate. It gives a detailed analysis of the potential for implementing the Clean Development Mechanism proposed under the Kyoto Protocol Convention on Climate Change in the agricultural sector of developing countries along with the relevant policy implications and requirements

Merchants of Doubt

How a Handful of Scientists Obscured the Truth on Issues from Tobacco Smoke to Global Warming

Bloomsbury Publishing USA Documents the troubling influence of a small group of scientists who the author contends misrepresent scientific facts to advance key political and economic agendas, revealing the interests behind their detractions on findings about acid rain, DDT, and other hazards.

Merchants of Doubt

How a Handful of Scientists Obscured the Truth on Issues from Tobacco Smoke to

Global Warming

A&C Black The U.S. scientific community has long led the world in research on such areas as public health, environmental science, and issues affecting quality of life. These scientists have produced landmark studies on the dangers of DDT, tobacco smoke, acid rain, and global warming. But at the same time, a small yet potent subset of this community leads the world in vehement denial of these dangers. *Merchants of Doubt* tells the story of how a loose-knit group of high-level scientists and scientific advisers, with deep connections in politics and industry, ran effective campaigns to mislead the public and deny well-established scientific knowledge over four decades. Remarkably, the same individuals surface repeatedly—some of the same figures who have claimed that the science of global warming is "not settled" denied the truth of studies linking smoking to lung cancer, coal smoke to acid rain, and CFCs to the ozone hole. "Doubt is our product," wrote one tobacco executive. These "experts" supplied it. Naomi Oreskes and Erik M. Conway, historians of science, roll back the rug on this dark corner of the American scientific community, showing how ideology and corporate interests, aided by a too-compliant media, have skewed public understanding of some of the most pressing issues of our era.

The Discovery of Global Warming

Harvard University Press The author of *Scientists in Power and Nuclear Fear* illuminates the scientific process that reached consensus in 2001 about global warming by assembling evidence from around the world to show the complex workings of the earth's climate and environment. The Uninhabitable Earth

Life After Warming

"It is worse, much worse, than you think. If your anxiety about global warming is dominated by fears of sea-level rise, you are barely scratching the surface of what terrors are possible. In California, wildfires now rage year-round, destroying thousands of homes. Across the US, "500-year" storms pummel communities month after month, and floods displace tens of millions annually. This is only a preview of the changes to come. And they are coming fast. Without a revolution in how billions of humans conduct their lives, parts of the Earth could become close to uninhabitable, and other parts horrifically inhospitable, as soon as the end of this century. In his travelogue of our near future, David Wallace-Wells brings into stark relief the climate troubles that await -- food shortages, refugee emergencies, and other crises that will reshape the globe. But the world will be remade by warming in more profound ways as well, transforming our politics, our culture, our relationship to technology, and our sense of history. It will be all-encompassing, shaping and distorting nearly every aspect of human life as it is lived today. Like *An Inconvenient Truth* and *Silent Spring* before it, *The Uninhabitable Earth* is both a meditation on the devastation we have brought upon ourselves and an impassioned call to action. For just as the world was brought to the brink of catastrophe within the span of a lifetime, the responsibility to avoid it now belongs to a single generation"--

Losing Earth

The Decade We Could Have Stopped Climate Change

Picador By 1979, we knew all that we know now about the science of climate change - what was happening, why it was happening, and how to stop it. Over the next ten years, we had the very real opportunity to stop it. Obviously, we failed. Nathaniel Rich's groundbreaking account of that failure - and how tantalizingly close we came to signing binding treaties that would have saved us all before the fossil fuels industry and politicians committed to anti-scientific denialism - is already a journalistic blockbuster, a full issue of the New York Times Magazine that has earned favorable comparisons to Rachel Carson's Silent Spring and John Hersey's Hiroshima. Rich has become an instant, in-demand expert and speaker. A major movie deal is already in place. It is the story, perhaps, that can shift the conversation. In the book *Losing Earth*, Rich is able to provide more of the context for what did - and didn't - happen in the 1980s and, more important, is able to carry the story fully into the present day and wrestle with what those past failures mean for us in 2019. It is not just an agonizing revelation of historical missed opportunities, but a clear-eyed and eloquent assessment of how we got to now, and what we can and must do before it's truly too late.

Climate Change and Risk. Securitization and Emergency in Global Governance

GRIN Verlag Seminar paper from the year 2014 in the subject Politics - International Politics - Environmental Policy, grade: 2,0, LMU Munich (Geschwister-Scholl-Institut für Politikwissenschaften), course: Spezialisierung Governance: Critical Security Studies Securitization and Emergency in Global Governance, language: English, abstract: "Climate change in IPCC usage refers to a change in the state of the climate that can be identified (e.g. using statistical tests) by changes in the mean and/or the variability of its properties, and that persists for an extended period, typically decades or longer. It refers to any change in climate over time, whether due to natural variability or as a result of human

activity." When such a change was seen in the past as a purely natural event, humankind now recognizes its own influence on the Earth's ecosystem. Since the 1970s academics and scientists are warning of a Global Warming caused by human activities by several publications like *The Limits to Growth* (1972). The issue became ultimately the public attention with the release of former US Presidential Candidate Al Gore's movie "An Inconvenient Truth" honored with an Academy Award in 2006 and the winning of the Nobel Peace prize by IPCC and Al Gore. For the matter of easy understanding I will put Climate Change synonymous to the recent phenomenon of Global Warming. Being a huge challenge for humankind there is a lively debate about the way facing it, mainly in which category of the trilogy politicization, securitization and riskification it falls. For such a categorization it is important to ask for the nature of Global Warming, so whether it is or should be treated as a political issue, a threat or a risk. Is climate change thus governed as a threat or a risk? Can we witness a successful securitization? Or is it more convenient to classify Climate Change into the concept of riskification? After providing the reader with each conceptual framework, I will challenge the theories with the issues of Climate Change. But first and foremost it will be needed to explain the relevance of Climate Change as an issue within security studies.

Weather, Climate and Human Affairs

A Book of Essays and Other Papers

"First published between 1966 and 1988, the four volumes in this collection demonstrate the immense breadth and depth of work on climate change by the pioneering English climatologist Hubert Lamb. Detailing everything from the fundamentals of climate and climatology, as well as a history of climatic change from the ice-age to the second half of the twentieth century, through to a consideration of how future climatic trends should be approached, this is a very comprehensive and laudable collection."--Publisher's website.

Climate Change and Cities

Second Assessment Report of the Urban Climate Change Research Network

Cambridge University Press The Urban Climate Change Research Network's Second Assessment Report on Climate Change in Cities (ARC3.2) is the second in a series of global, science-based reports to examine climate risk, adaptation, and mitigation efforts in cities. The book explicitly seeks to explore the implications of changing climatic conditions on critical urban physical and social infrastructure sectors and intersectoral concerns. The primary purpose of ARC3.2 is to inform the development and implementation of effective urban climate change policies, leveraging ongoing and planned investments for populations in cities of developing, emerging, and developed countries. This volume, like its predecessor, will be invaluable for a range of audiences involved with climate change and cities: mayors, city officials and policymakers; urban planners; policymakers charged with developing climate change mitigation and adaptation programs; and a broad spectrum of researchers and advanced students in the environmental sciences.

Critical Analysis of the Climate Crisis. The Effects of Global Warming

A Short Overview

GRIN Verlag Seminar paper from the year 2019 in the subject Politics - Environmental Policy, grade: 1,3, University of Applied Sciences Essen, language: English, abstract: This essay aims to first provide a theoretical basis to the reader, explaining the elemental scientific consent about climate change. In the following, the effects of global warming on the environment, the economy and on us citizens will be outlined. As mentioned above, the main part of this paper is the presentation of the effects global warming has on various sectors, and the analysis of the current climate policy. It is built on this analysis by identifying approaches that not only politics but also, we as consumers can take to limit the effects our lives have of the earth's environment and climate. The last step is to draw a conclusion and present an outlook.

The Lonely Polar Bear

Fox Chapel Publishing This sweet children's picture book presents a moving story, set in a fragile Arctic world threatened by global warming. A little polar bear wakes up alone after a furious storm. With his mother nowhere in sight, he makes friends with a mysterious little girl and various animal companions. All of the friends come together in the magnificent polar sky. In the end the little bear sits peacefully, enjoying a winter day lit up by beautiful northern lights. Featuring exceptional illustrations from talented Vietnamese illustrator Khoa Le, *The Lonely Polar Bear* offers an accessible way to introduce children to climate change issues.

Six Degrees

Our Future on a Hotter Planet

National Geographic Books In accessible journalistic prose, author Lynas distills what environmental scientists predict about the consequences of human pollution for the next hundred years, degree by degree. At 1 degree Celsius, most coral reefs and many mountain glaciers will be lost. A 3-degree rise would spell the collapse of the Amazon rainforest, disappearance of Greenland's ice sheet, and the creation of deserts across the Midwestern United States and southern Africa. A 6-degree increase would eliminate most life on Earth, including much of humanity. Based on authoritative scientific articles, the latest computer models, and information about past warm events in Earth history, this promises to be an eye-opening warning that humanity will ignore at its peril.--From publisher description.

Historical Perspectives on Climate Change

Oxford University Press This intriguing volume provides a thorough examination of the historical roots of global climate change as a field of inquiry, from the Enlightenment to the late twentieth century. Based on primary and archival sources, the book is filled with interesting perspectives on what people have understood, experienced, and feared about the climate and its changes in the past. Chapters explore climate and culture in Enlightenment thought; climate debates in early America; the development of international networks of observation; the scientific transformation of climate discourse; and early contributions to understanding terrestrial temperature changes, infrared radiation, and the carbon dioxide theory of climate. But perhaps most important, this book shows what a study of the past has to offer the interdisciplinary investigation of current environmental problems.

A World Without Ice

Penguin A co-winner of the 2007 Nobel Peace Prize offers a clear-eyed explanation of the planet's imperiled ice. Much has been written about global warming, but the crucial relationship between people and ice has received little focus—until now. As one of the world's leading experts on climate change, Henry Pollack provides an accessible, comprehensive survey of ice as a force of nature, and the potential consequences as we face the possibility of a world without ice. *A World Without Ice* traces the effect of mountain glaciers on supplies of drinking water and agricultural irrigation, as well as the current results of melting permafrost and shrinking Arctic sea ice—a situation that has degraded the habitat of numerous animals and sparked an international race for seabed oil and minerals. Catastrophic possibilities loom, including rising sea levels and subsequent flooding of lowlying regions worldwide, and the ultimate displacement of millions of coastal residents. *A World Without Ice* answers our most urgent questions about this pending crisis, laying out the necessary steps for managing the unavoidable and avoiding the unmanageable.

Science and Technology

GRIN Verlag Essay from the year 2018 in the subject Earth Science / Geography - General, Basics, , language: English, abstract: The planet earth is growing less and less accommodative with every year that passes. The reason being, we as the human being do not care about taking care of the Mother Nature and it is striking back. Global warming, rising sea levels catastrophic coast flooding are some of the ways the planet is biting back. No person alive is immune to the effects of climate change. As to this reason every person ought to be accountable to the survival of the planet. We never seem to get enough from science and technology that is after it has provided us with nice cars to minimize walking distance and a lot of other invention that science has provided. Similarly, because of science and technology life is bearable however the same technology destroys the environment. It is a time the people introduces other ways that will not change our lifestyle but ways that will improve it. This project will demonstrate a minor way in which we can be accountable and at the same time not limiting our lives to ensure that the human and animal species in the planet can survive. Additionally, the project will drive to deem or minimize the amount of excess carbon dioxide released by motor vehicle into the environment. Basically, the project will try to mime the plant's process of photosynthesis whereby it absorbs carbon dioxide from the environment and uses it to make its own food in the process giving out by products of oxygen and water.

Climate Confusion

How Global Warming Hysteria Leads to Bad Science, Pandering Politicians and Misguided Policies That Hurt the Poor

Encounter Books The current frenzy over global warming has galvanized the public and cost taxpayers billions of dollars in federal expenditures for climate research. It has spawned Hollywood blockbusters and inspired major political movements. It has given a higher calling to celebrities and built a lucrative industry for scores of eager scientists. In short, ending climate change has become a national crusade. And yet, despite this dominant and sprawling campaign, the facts behind global warming remain as confounding as ever. In Climate Confusion, distinguished climatologist Dr. Roy Spencer observes that our obsession with global warming has only clouded the issue. Forsaking blindingly technical statistics and doomsday scenarios, Dr. Spencer explains in simple terms how the climate system really works, why man's role in global warming is more myth than science, and how the global warming hype has corrupted Washington and the scientific community. The reasons, Spencer explains, are numerous: biases in governmental funding of scientific research, our misconceptions about science and basic economics, even our religious beliefs and worldviews. From Al Gore to Leonardo DiCaprio, the climate change industry has given a platform to leading figures from all walks of life, as pandering politicians, demagogues and biased scientists forge a self-interested movement whose proposed policy initiatives could ultimately devastate the economies of those developing countries they purport to aid.

The Global Warming Reader

A Century of Writing About Climate Change

Penguin Van Jones, Al Gore, Elizabeth Kolbert, Naomi Klein, and other essential voices on global warming, from its 19th-century discovery to the present, in a volume edited by Bill McKibben, our most widely respected environmental writer With the rise of extreme weather events worldwide--witness the devastation wrought by Hurricanes Sandy, Irene, and Katrina, and the sustained drought across the American West--global warming has become increasingly difficult to deny. What is happening to our planet? And what can we do about it? The Global Warming Reader provides more than thirty-five answers to these burning questions, from more than one hundred years of engagement with the topic. Here is Elizabeth Kolbert's groundbreaking essay "The Darkening Sea," Michael Crichton's skeptical view of climate change, George Monbiot's biting indictment of those who are really using up the planet's resources, NASA scientist James Hansen's testimony before the U.S. Congress, and clarion calls for action by Al Gore, Arundhati Roy, Naomi Klein, Van Jones, and many others. The Global Warming Reader is a comprehensive resource, expertly edited by someone who lives and breathes this defining issue of our time.

The Fable of a Stable Climate

Dr Gerrit J. van der Lingen is a geologist and paleoclimatologist. Studying climate change in the past made him realise that the belief in modern catastrophic man-made global warming, caused by carbon dioxide, is not supported by sound science. He became involved in the debate between the belief in dangerous man-made global warming and science based on observations and actual measurements, a debate between ideology and proper science. For fifteen years he wrote articles, gave lectures and took part in oral and published debates. He has now collated these activities in this book. These "memoirs" provide a fascinating insight in the disagreements about this global obsession. Most information provided to the public about climate change comes from persons who study weather and weather processes, to whom a 150 year long temperature record represents "a long time". To Dr van der Lingen, 150 years represents just a single heartbeat of the geological history that provides the proper context within which to judge modern climate danger. Read this book not just for the intelligent perspective it provides on the global warming scam, but also because it is at the same time a rattling good account of some of the most fascinating aspects of the history of our planet Earth. Professor Bob Carter, Townsville, Australia - Author of "Climate: The Counter Consensus" and "Taxing Air" For many years Dr van der Lingen has been actively engaged in debunking the man-made global warming hype, exposing the facts as an antidote against the misinformation, bordering on climate propaganda, which is often presented in the mainstream media. The result of his endeavors can be found in this fine and easily accessible collection of essays, which is a must read for all who are interested in what is mistakenly called the 'greatest threat to mankind'. Hans Labohm, Leimuiden, The Netherlands - Independent economist and lead author of "Man-Made Global Warming: Unraveling a Dogma". As a non-scientific layman who found himself absorbed into the 'global warming' (a.k.a. 'climate change') debate in 2006, I found I had a lot to learn from genuine experts in the related sciences, first Professor Augie Auer, then Prof Bob Carter, and then Dr Gerrit van der Lingen. As a geologist and paleoclimatologist, Gerrit has the rare skill of making complex issues immediately comprehensible to laypeople like me, presenting relevant facts with convincing and easily understandable clarity. Terry Dunleavy MBE, Auckland New Zealand - Co-founder New Zealand Climate Science Coalition; founding chairman, International Climate Science Coalition. There are many books available debunking today's cause célèbre of human-induced climate change - also known as 'man-made global warming', but one of the most approachable and enjoyable to read is this collection of essays and articles by Dr. Gerrit van der Lingen. Dr. van der Lingen's arguments slice through the nonsense like a scythe, exposing it for what it is: the biggest, most expensive pseudo-scientific scam in history. Anyone who wants to know how and why a supposedly scientific debate morphed into a political movement motivated by a smorgasbord of agendas should read this book. Joe Fone, Christchurch, New Zealand - Author of 'Climate Change: Natural or Manmade?'

What If We Stopped Pretending?

HarperCollins UK The climate change is coming. To prepare for it, we need to admit that we can't prevent it.

Quarterly Essay 45 Us and Them

On the Importance of Animals

Black Inc. For the first time in history, humans sit unchallenged at the top of the food chain. As we encroach on the wild and a vast wave of extinctions gathers force, how has our relationship with animals changed? In this dazzling essay, Anna Krien investigates the world we have made and the complexity of the choices we face. From pets to the live cattle trade, from apex predators to scientific experiments, Krien shows how we should - and do - treat our fellow creatures. As she delves deeper, she finds that animals can trigger primal emotions in us, which we are often unwilling to acknowledge. This is a clear-eyed meditation on humanity and animality, us and them, that brings out the importance of animals in an unforgettable way. "I am not weighing up whether our treatment of animals is just, because it isn't. That age-old debate is a farce - deep down we all know it. The real question is, just how much of this injustice are we prepared to live with?" —Anna Krien, *Us and Them*
