Air Breathing Engines

I. K. International Pvt Ltd **The book deals with the theory of Air Breathing Engines or more precisely aircraft engines. These engines take air from the atmosphere, accelerate and produce thrust to the aircraft. Gas turbine forms the basic unit and is gas generator. The components of the gas turbines are given in detail. It is a machine based on which is developed Turbo Prop and Turbo Jet Engines. Rocket has been considered as non-breathing engine. The book will be useful for Aeronautical Engineering students. The book contains worked out examples taken from the data of leading**

aircraft manufacturers. The book will be suitable for Mechanical Engineering, Aerospace and Aircraft Engineering courses. The space scientist and students working for space travel can also benefit from this book. The book will offer working knowledge of the operation of the aircraft to engineers in this area.

Design and Performance of Gas Turbine Power Plants

Princeton University Press Volume XI of the High Speed Aerodynamics and Jet Propulsion series. Edited by W.R. Hawthorne and W.T. Olson. This is a comprehensive presentation of basic problems involved in the design of aircraft gas turbines, including sections covering requirements and processes, experimental techniques, fuel injection, flame stabilization, mixing processes, fuels, combustion chamber development, materials for gas turbine applications, turbine blade vibration, and performance. Originally published in 1960. The Princeton Legacy Library uses the latest print-on-demand technology to again make available previously out-of-print books from the distinguished backlist of Princeton University Press. These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions. The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905.
