Experiments with Operational Amplifiers Learning by Doing Food Allergy in Infancy and Childhood Springer Science & Business Media Since the beginning of the century when HAMBURGER, SCHLOSS MANN, and MORO first described food allergy in infants being fed with cow's milk, this topic has been the subject of very controversial discussions among pediatricians. The dispute is illustrated by markedly fluctuating incidence figures, ranging from denial of the disease to incidence rates up to one in ten infants. The explanation for the differing incidence figures lies in the lack of a single laboratory test which is simple as well as applicable and reliable for all clinical and immunological reactions. Even

though the classic allergic hypersensitivity reactions mediated by specific IgE antibodies are relatively clearly defined, there still exist other more complex immune responses which are more difficult to recognize. In the fall of 1987 internationally renowned experts from various fields met to define and discuss the fundamentals, organic manifestations, and the current status of diagnosis, treatment, and prevention of food allergy in childhood. The results have been collected in the volume in hand, in hopes that it will encourage more public involvement in the discussion of this illness, which is fortunately mostly transient.

WRITING ON THE WALL Ozone-Forming Potential of Reformulated Gasoline National Academies Press The Committee on Ozone-Forming Potential for Reformulated Gasoline was asked whether the existing body of

scientific and technical information is sufficient to permit a robust evaluation and comparison of the emissions from motor vehicles using different reformulated gasolines based on their ozone-forming potentials and to assess the concomitant impact of that approach on air-quality benefits of the use of oxygenates within the RFG program. As part of its charge, the committee was asked to consider (1) the technical soundness of various approaches for evaluating and comparing the relative ozone-forming potentials of RFG blends, (2) technical aspects of various air-quality issues related to RFG assessment, and (3) the sensitivity of evaluations of the relative ozone-forming potentials to factors related to fuel properties and the variability of vehicle technologies and driving patterns.
